

1. ABSTRACT

This project presents an interactive data analysis dashboard based on Shark Tank India data, focusing on startup pitches, accepted deals, investment amounts, investor participation, industry distribution, and presenter demographics. An interactive Power BI dashboard was developed using key performance indicators, charts, and slicers for Industry and Season Number, providing a visual understanding of investment trends, investor participation, industry performance, and presenter patterns.

789 Total Pitches	434 Accepted Offers	1,147 Male Presenters	429 Female Presenters
-----------------------------	-------------------------------	---------------------------------	---------------------------------

2. INTRODUCTION

Shark Tank India is a platform where entrepreneurs present their business ideas to investors and seek investment. The dataset used in this project contains information about startup pitches, industries, investments, deals, investors, presenters, and other business-related attributes. The objective was to clean and organize the available data and develop meaningful visualizations for investment and industry analysis, helping users quickly understand pitches, successful deals, investment amounts, investor participation, industry trends, and presenter demographics. The project also supports industry-wise investor trend analysis and a presenter-based success pattern using demographic and accepted-offer information.

3. TOOLS USED

- **Power BI** — Interactive dashboard, KPI cards, charts, slicers, and data visualizations.
- **DAX** — Calculated tables to organize investor and presenter information for analysis.
- **Microsoft Excel / CSV Dataset** — Source data for the project.
- **Microsoft Word** — Preparation of the project report and summary documents.
- **PDF** — Final format for submitting the dashboard and project report

4. STEPS INVOLVED IN BUILDING THE PROJECT

Step 1 · Data Collection	The Shark Tank India dataset was collected and loaded into Power BI.
Step 2 · Data Organization	Fields were examined and organized by industry, investment, deal, investor, and presenter information.
Step 3 · KPI Creation	KPIs were created for total pitches, total deals, total deal amount, and average deal valuation.
Step 4 · Investor Analysis	Investor data was organized using DAX tables for investment amounts and deal participation visuals.

Step 5 · Industry Analysis	Charts were created to analyze industry-wise startup distribution and funding/deal amounts.
Step 6 · Presenter Analysis	Male, female, and transgender presenter data was analyzed via a presenter table and demographic chart.
Step 7 · Deal Success Analysis	Accepted offers were analyzed to understand industry-wise deal success patterns.
Step 8 · Dashboard Design	A single-page interactive dashboard was built with KPI cards, charts, slicers, and consistent formatting.
Step 9 · Final Output	The dashboard was exported as PDF, with a separate presenter success pattern summary prepared.

5. CONCLUSION

The Shark Tank India analysis project successfully transformed the available startup and investment data into an interactive Power BI dashboard, providing a clear view of overall pitches and deals, investment amounts, investor participation, industry trends, and presenter demographics. The analysis recorded 789 pitches and 434 accepted offers, while the presenter data included 1,147 male presenters, 429 female presenters, and 3 transgender presenters — offering useful insights into the distribution of startup presentations and deal activity. Overall, the project demonstrates how data organization, DAX, KPI analysis, and interactive visualization can convert raw business data into meaningful insights, with the final dashboard and supporting reports providing a concise and professional representation of the analysis.
